Drugs and Drug Policy 2011-07-13 estimates indicate that as many as 1 in 4 americans will experience a mental health problem or will misuse alcohol or drugs in their lifetimes these disorders are among the most
highly stigmatized health conditions in the United States and they remain barriers to full participation in society in areas as basic as education, housing, and employment. Improving the lives of people with mental health and substance abuse disorders has been a priority in the United States for more than 50 years. The Community Mental Health Act of 1963 is considered a major turning point in America’s efforts to improve behavioral healthcare. It ushered in an era of optimism and hope and laid the groundwork for the consumer movement and new models of recovery. The consumer movement gave voice to people with mental and substance use disorders and brought their perspectives and experiences into national discussions about mental health. However, over the same 50-year period, positive change in American public attitudes and beliefs about mental and substance use disorders has lagged behind. These advances in stigma are a complex social phenomenon based on a relationship between an attribute and a stereotype that assigns undesirable labels, qualities, and behaviors to a person with that attribute. Labeled individuals are then socially devalued, which leads to inequality and discrimination. This report contributes to national efforts to understand and change attitudes, beliefs, and behaviors that can lead to stigma and discrimination. Changing stigma in a lasting way will require coordinated efforts that are based on the best possible evidence supported at the national level with multi-year funding and planned and implemented by an effective coalition of representative stakeholders. Ending discrimination against people with mental and substance use disorders requires addressing stigma and discrimination faced by individuals with mental or substance use disorders and recommending effective strategies for reducing stigma and encouraging people to seek treatment and other supportive services. It offers a set of conclusions and recommendations about successful stigma change strategies and the research needed to inform and evaluate these efforts in the United States.

All across the United States individuals, families, communities, and health care systems are struggling to cope with substance use, misuse, and substance use disorders. Substance misuse and substance use disorders have devastating effects, disrupt the future plans of too many young people and all too often end lives prematurely and tragically. Substance misuse is a major public health challenge and a priority for our nation to address. The effects of substance use are cumulative and costly for our society, placing burdens on workplaces, the health care system, families, states, and communities. The report discusses opportunities to bring substance use disorder treatment and mainstream health care systems into alignment so that they can address a person’s overall health rather than a substance misuse or a physical health condition alone or in isolation. It also provides suggestions and recommendations for action that everyone—individuals, families, community leaders, law enforcement, health care professionals, policymakers, and researchers—can take to prevent substance misuse and reduce its consequences.
